CLAIMS:

What is claimed is:

1. A method in a data processing system for providing hardware assistance to prefetch data during execution of code by a processor in the data processing system, the method comprising:

responsive to loading an instruction in the code into a cache, determining, by a processor unit, whether a prefetch indicator is associated with the instruction; and

responsive to the prefetch indicator being associated with the instruction, selectively prefetching a pointer to a data structure identified by the prefetch indicator into the cache in the processor.

- 2. The method of claim 1, wherein the prefetch indicator contains the pointer to the data structure.
- 3. The method of claim 1, wherein the selectively prefetching step includes:

determining whether outstanding cache misses are present; and

prefetching the data if a number of outstanding cache misses are less than a threshold.

4. The method of claim 1, wherein the selectively prefetching step includes:

determining whether to replace cache lines; and

prefetching the data if a number of cache lines chosen to be replaced are greater than a threshold.

- 5. The method of claim 1, wherein the processor unit is selected from one of an instruction cache, data cache, or a load/store unit.
- 6. The method of claim 1, wherein the cache is an instruction cache.
- 7. The method of claim 1, wherein the cache is a data cache.
- 8. A data processing system comprising:
- a cache in a processor in the data processing system; and
- a load/store unit in the processor, wherein the load/store unit determines whether a prefetch indicator is associated with an instruction in response to loading the instruction for execution into the cache, the load/store unit selectively prefetches a pointer to a data structure identified by the prefetch indicator into the cache using metadata associated with the instruction.
- 9. The data processing system of claim 8, wherein the cache is at least one of an instruction cache and a data cache.

- 10. The data processing system of claim 8, wherein the load/store unit selectively prefetches the pointer to the data structure based on a determination by the cache as to whether the prefetch is to occur.
- 11. A data processing system for providing hardware assistance to prefetch data during execution of code by a process or in the data processing system, the data processing system comprising:

determining means, responsive to loading an instruction in the code into a cache, for determining, by the a processor unit, whether a prefetch indicator is associated with the instruction; and

selectively prefetching means, responsive to the prefetch indicator being associated with the instruction, for selectively prefetching a pointer to a data structure identified by the prefetch indicator into the cache in the processor.

- 12. The data processing system of claim 11, wherein the prefetch indicator contains the pointer to the data structure.
- 13. The data processing system of claim 11, wherein the selectively prefetching means includes:

means for determining whether outstanding cache misses are present; and

means for prefetching the data if a number of outstanding cache misses are less than a threshold.

14. The data processing system of claim 11, wherein the selectively prefetching means includes:

means for determining whether to replace cache lines; and

means for prefetching the data if a number of cache lines chosen to be replaced are greater than a threshold.

- 15. The data processing system of claim 11, wherein the processor unit is selected from one of an instruction cache, a data cache, or a load/store unit.
- 16. The data processing system of claim 11, wherein the cache is an instruction cache.
- 17. The data processing system of claim 11, wherein the cache is a data cache.
- 18. A computer program product in a computer readable medium for providing hardware assistance to prefetch data during execution of code by a process or in the data processing system, the computer program product comprising:

first instructions, responsive to loading an instruction in the code into a cache, for determining, by the a processor unit, whether a prefetch indicator is associated with the instruction; and

second instructions, responsive to the prefetch indicator being associated with the instruction, for selectively prefetching a pointer to a data structure

identified by the prefetch indicator into the cache in the processor.

- 19. The computer program product of claim 18, wherein the prefetch indicator contains the pointer to the data structure.
- 20. The computer program product of claim 18, wherein the second instructions includes:

first sub-instructions for determining whether outstanding cache misses are present; and

second sub-instructions for prefetching the data if a number of outstanding cache misses are less than a threshold.

21. The computer program product of claim 18, wherein the second instructions includes:

first sub-instructions for determining whether to replace cache lines; and

second sub-instructions for prefetching the data if a number of cache lines chosen to be replaced are greater than a threshold.

- 22. The computer program product of claim 18, wherein the processor unit is selected from one of an instruction cache, a data cache, or a load/store unit.
- 23. The computer program product of claim 18, wherein the cache is an instruction cache.

24. The computer program product of claim 18, wherein the cache is a data cache.
